## P2 Chapter 2: Graphing Functions

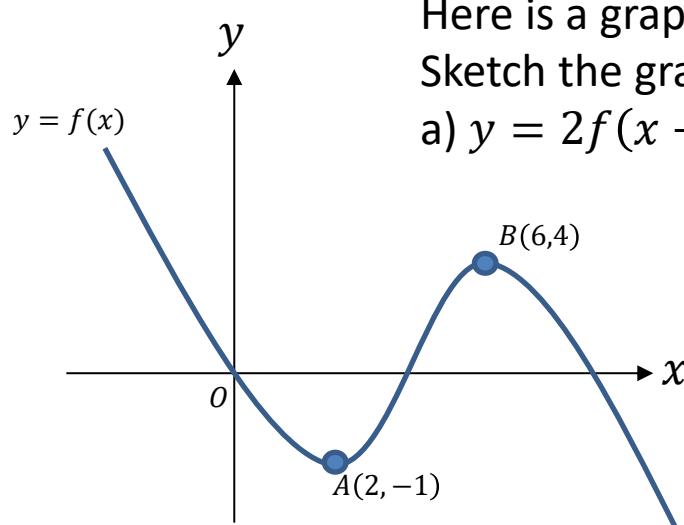

### Combining Transformations

# Combining Transformations

## RECAP:

	Affects which axis?	What we expect or opposite?
Change <b>inside</b> $f()$	$x$	Opposite
Change <b>outside</b> $f()$	$y$	What we expect

There is nothing new here relative to Year 1, except that you might have to do more than one transformation...

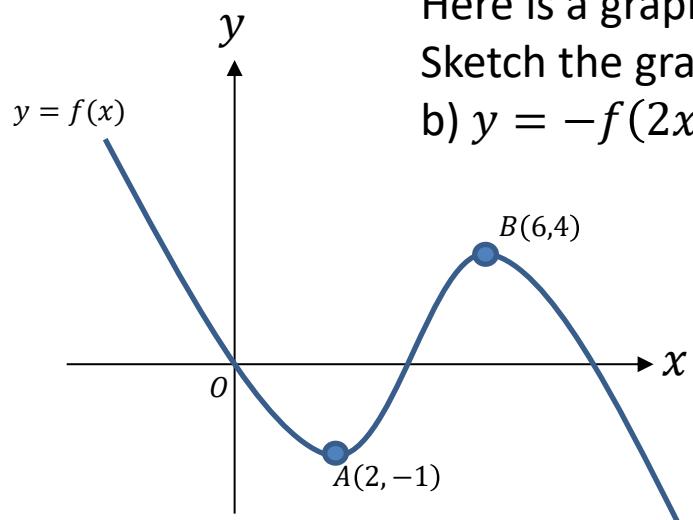

Here is a graph of  $y = f(x)$ . Sketch the graph of:  
a)  $y = 2f(x + 2)$

**Subtract 2 from  $x$  values.  
 $y$  values multiplied by 2.**

Start with the points you have coordinates of first!

# Combining Transformations

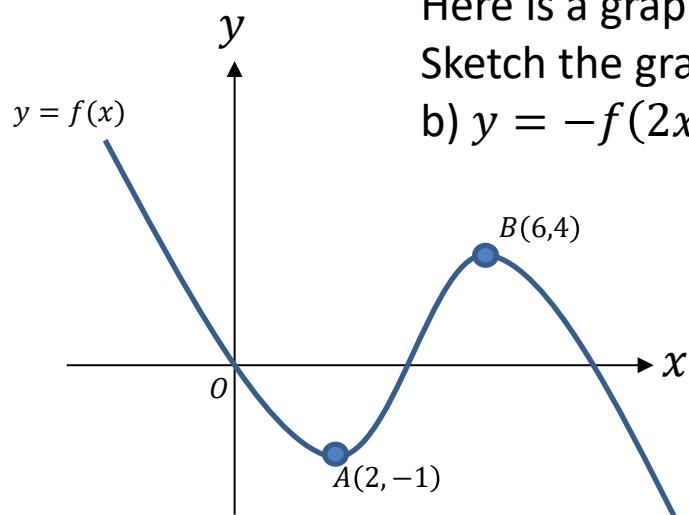

Here is a graph of  $y = f(x)$ .  
Sketch the graph of:  
b)  $y = -f(2x)$

c)  $y = |f(-x)|$

? b

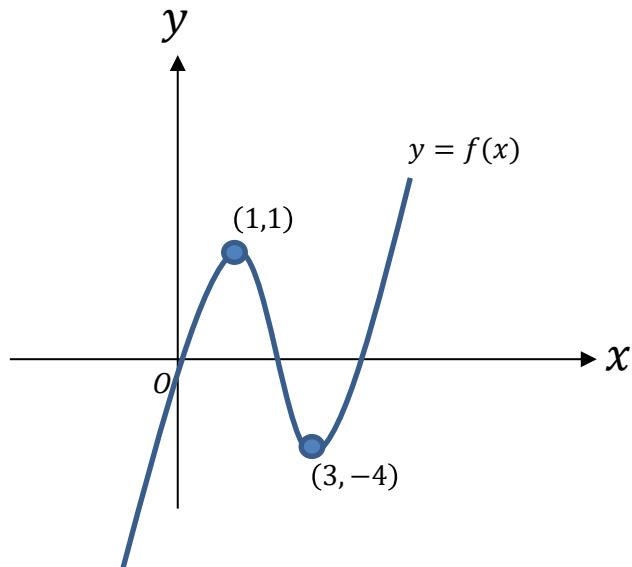

? c

# Combining Transformations

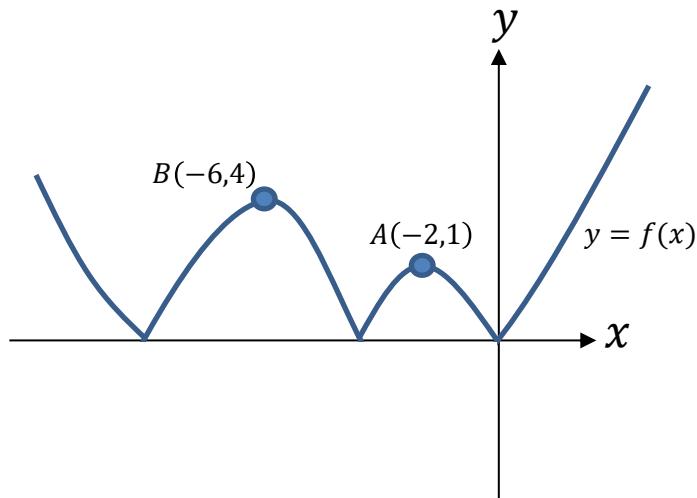

Here is a graph of  $y = f(x)$ .  
Sketch the graph of:  
b)  $y = -f(2x)$

**Halve  $x$  values.  
 $y$  values negated.**

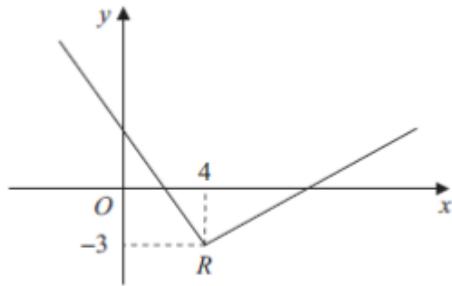

c)  $y = |f(-x)|$

**$x$  values negated.  
Negative  $y$  flipped up.**

# Test Your Understanding

C4 June 2011 Q3

**Figure 1**

Figure 1 shows part of the graph of  $y = f(x)$ ,  $x \in \mathbb{R}$ .

The graph consists of two line segments that meet at the point  $R(4, -3)$ , as shown in Figure 1.

Sketch, on separate diagrams, the graphs of

- (a)  $y = 2f(x + 4)$ , (3)  
(b)  $y = |f(-x)|$ . (3)

On each diagram, show the coordinates of the point corresponding to  $R$ .

(a)

? a

(b)

? b

# Test Your Understanding

C4 June 2011 Q3

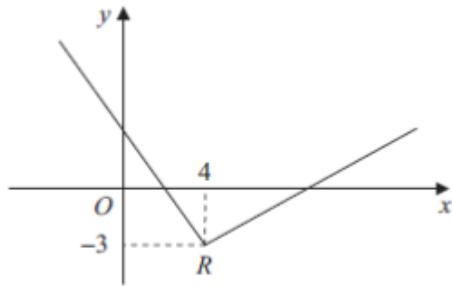

Figure 1

Figure 1 shows part of the graph of  $y = f(x)$ ,  $x \in \mathbb{R}$ .

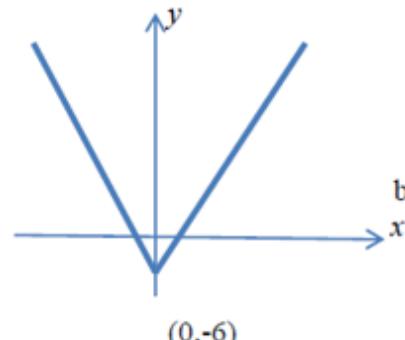

The graph consists of two line segments that meet at the point  $R(4, -3)$ , as shown in Figure 1.

Sketch, on separate diagrams, the graphs of

- (a)  $y = 2f(x + 4)$ ,  
(b)  $y = |f(-x)|$ .

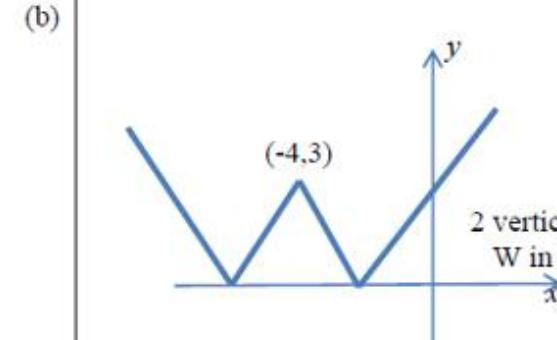

(3)  
(3)

On each diagram, show the coordinates of the point corresponding to  $R$ .

V shape  
vertex on  $y$  axis & both  
branches of graph cross  $x$  axis  
 $'y'$  co-ordinate of  $R$  is -6

B1  
B1  
B1

W shape  
2 vertices on the negative  $x$  axis.  
W in both quad 1 & quad 2.  
 $R' = (-4, 3)$

# What if two $x$ changes or two $y$ changes?

$$y = 2f(x) + 1$$

?

$$y = f(2x + 1)$$

You will not get multiple  $x$  transformations in your exam, but theoretically...

?

Sketch  $y = \ln(1 - 2x)$

?

# What if two $x$ changes or two $y$ changes?

$$y = 2f(x) + 1$$

The  $y$  values are multiplied by 2, and then 1 is added.

$$y = f(2x + 1)$$

You will not get multiple  $x$  transformations in your exam, but theoretically...

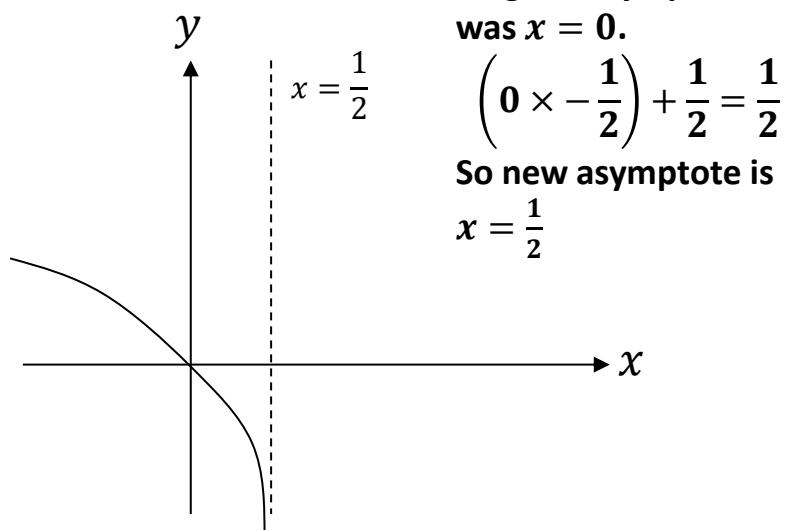

The easiest way is to think of the **inverse function** of  $2x + 1$ , i.e.  $\frac{x-1}{2}$ .

This gives us the changes to the  $x$  values, and in the correct order! In this case, we would -1 from the  $x$  values (translation 1 left) and then halve the  $x$  values (stretch on  $x$ -axis of scale factor  $\frac{1}{2}$ )

Sketch  $y = \ln(1 - 2x)$

Inverse of  $1 - 2x$  is  $\frac{1-x}{2} = -\frac{1}{2}x + \frac{1}{2}$

So multiply  $x$  values by  $-\frac{1}{2}$  and then add  $\frac{1}{2}$ .

---

# Homework Exercise

- 1 The diagram shows a sketch of the graph  $y = f(x)$ .

The curve passes through the origin  $O$ , the point  $A(-2, -2)$  and the point  $B(3, 4)$ .

On separate axes, sketch the graphs of:

a  $y = 3f(x) + 2$

b  $y = f(x - 2) - 5$

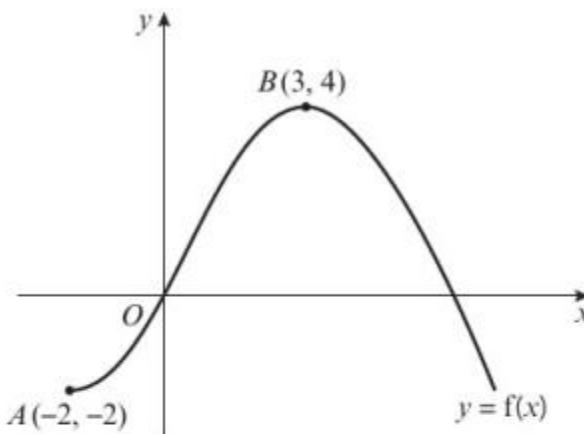

c  $y = \frac{1}{2}f(x + 1)$

d  $y = -f(2x)$

e  $y = |f(x)|$

f  $y = |f(-x)|$

In each case find the coordinates of the images of the points  $O$ ,  $A$  and  $B$ .

- 2 The diagram shows a sketch of the graph  $y = f(x)$ .

The curve has a maximum at the point  $A(-1, 4)$  and crosses the axes at the points  $(0, 3)$  and  $(-2, 0)$ .

On separate axes, sketch the graphs of:

a  $y = 3f(x - 2)$

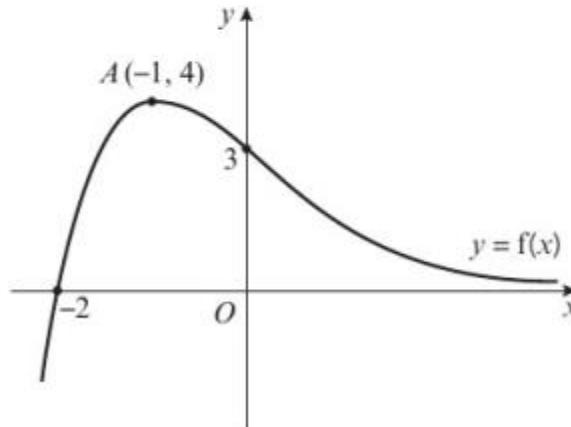

b  $y = \frac{1}{2}f\left(\frac{1}{2}x\right)$

c  $y = -f(x) + 4$

d  $y = -2f(x + 1)$

e  $y = 2f(|x|)$

For each graph, find, where possible, the coordinates of the maximum or minimum and the coordinates of the intersection points with the axes.

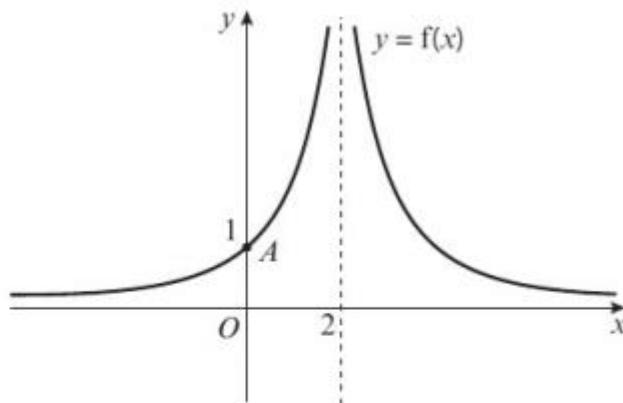

# Homework Exercise

- 3 The diagram shows a sketch of the graph  $y = f(x)$ .  
The lines  $x = 2$  and  $y = 0$  (the  $x$ -axis) are asymptotes to the curve.

On separate axes, sketch the graphs of:

- a  $y = 3f(x) - 1$       b  $y = f(x + 2) + 4$   
c  $y = -f(2x)$       d  $y = f(|x|)$

For each part, state the equations of the asymptotes and the new coordinates of the point A.

- 4 The function g is defined by

$$g: x \mapsto (x - 2)^2 - 9, x \in \mathbb{R}.$$

- a Draw a sketch of the graph of  $y = g(x)$ , labelling the turning point and the  $x$ - and  $y$ -intercepts. (3 marks)
- b Write down the coordinates of the turning point when the curve is transformed as follows:
- i  $2g(x - 4)$  (2 marks)
  - ii  $g(2x)$  (2 marks)
  - iii  $|g(x)|$  (2 marks)
- c Sketch the curve with equation  $y = g(|x|)$ . On your sketch show the coordinates of all turning points and all  $x$ - and  $y$ -intercepts. (4 marks)

# Homework Exercise

5  $h(x) = 2 \sin x, -180^\circ \leq x \leq 180^\circ.$

a Sketch the graph of  $y = h(x).$

b Write down the coordinates of the minimum,  $A$ , and the maximum,  $B$ .

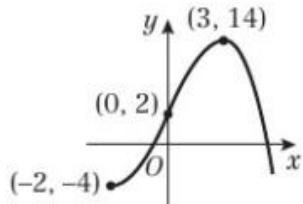

c Sketch the graphs of:

i  $h(x - 90^\circ) + 1$       ii  $\frac{1}{4}h\left(\frac{1}{2}x\right)$       iii  $\frac{1}{2}|h(-x)|$

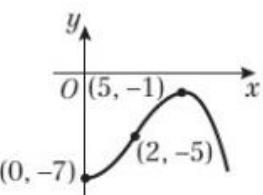

In each case find the coordinates of the images of the points  $O$ ,  $A$  and  $B$ .
